GEOMAGNETICS REPORT

2020

TANGERANG GEOPHYSICS STATION

FOREWORD

A big thanks we pray to God Almighty because of His Mercy, Geomagnetic Report 2020 of the Tangerang Geophysics Station can be completed. This report consist of the record of magnetic data by variograph digital (Lemi-018), proton precision magnetometers, Declination Inclination Magnetometers (DIM) and proton portable magnetometers for a period of 1 (one) year. Absolute magnetic observations are always carried out every Wednesday and Friday, meanwhile the digital measurements are recorded 24 hours for a year. In 2020, Tangerang Geophysics Station didn't record any indication of magnetic storm event.

It is our hope that this publication will be useful for scientists and researchers, policy- and decision-makers, as well as practitioners working in the frontline of leveraging the scientific knowledge on global environment change. This Geomagnetic Report is still far from perfect, we hope for suggestions and feedback for this report.

INTRODUCTION

This yearbook presents the result of the magnetic measurements at Tangerang (TNG) Geomagnetic Observatory in 2020. Tangerang Geophysics Station was established in 1964 with one of the activities is geomagnetic measurement.

The location of the station is about 25 km Western of Jakarta.

The Tangerang Geophysics Station is located in:

Geographic Latitude	: 06 10.29 S
Geographic Longitude	: 106 38.81 E
Elevation	: 11.37 meters
Local Mean Time	: 105 E (GMT + 7 hours)
Environment	: Ricefields and Houses
Base	: Sandstone

There are two kind of geomagnetic measurements, they are Absolute Measurements and Digital Measurements.

Absolute Measurements are taken twice a week, the instrument used are:

1. DIM - 100 for Declination and Inclination component
2. Proton Magnetometer for Total Intensity

Digital Measurements are recorded 24 hours, the instrument used are:

1. Variograph Digital for Horizontal, Vertical, Declination, Inclination, X and Y variation
2. Proton Magnetometer Digital for Total Intensity.

The other activities at Tangerang Geophysics Station are:

1. Climatology Observation.
2. Seismology observation.
3. Lighting Monitoring.
4. Air and Water Pollution Monitoring.

EARTH MAGNETISM

Earth's magnetic field can be described as Magnet field generated by a giant bar magnet located within the earth's core, but doesn't coincide with the geographic north-south line of the earth. While the magnetic field strength comes largely from within the earth itself (98%) or magnetic fields (internal field), while the rest (2%) caused by magnetic induction rocks of the crust and the outer space. Internal magnetic field derived from the earth's core (inner core) and crust (crustal earth). Some of the reasons that the Earth has a magnetic field are:

1. The high-speed rotation of the Earth.
2. The process of mantle convection with the outer core of the earth (be lumpy).
3. The inner core (solid) is conductive, iron-rich content.

The magnetic field is expressed as the magnitude and direction (vector), the direction is expressed as declination (deviation to the north-south geographic) and inclination (deviation from the direction of the horizontal magnetic north pole).

Declination is a large deviation angle to the direction of magnetic to the north-south geographic.

Inclination is a large deviation angle to the direction of magnetic to the horizontal direction (Reynolds, 1995).

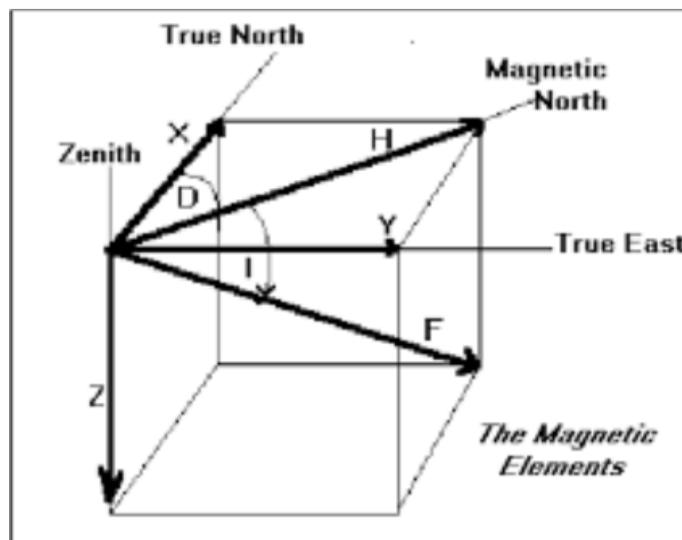

GEOMAGNETIC POLE

Geomagnetic poles is the intersection angle of the geographic poles of the magnetic axis of the earth with the rod hypotheses that were placed in the center of the earth and is estimated as the geomagnetic field. There is a sort of polar each hemisphere and polar called geomagnetic north pole and south geomagnetic poles.

note: the earth has two poles are often known as geomagnetic poles which is the theoretical poles where the magnetic axis makes an angle of 11.5° with the axis of rotation of the earth is at:

- a. The magnetic north pole is located in the Canadian Arctic Island with latitude 75.5° BT and 100.4° BB longitude.
- b. Magnetic south pole is located in the Coast of Antarctica's South of Tasmania with a latitude of 66.5° LS and 140° BT longitude.

The figure below describes the principle of magnetic methods are illustrated using a cube-shaped object, then the components used on the principle

of magnetic methods that relied on the x-axis (geographic north) and the y-axis (east geographical), then determined the direction of the magnetic meridian (H) which is to get the value of the angle formed from the geographic north direction toward magnetic north is to calculate the value of the declination, and then determined the direction of the total intensity (F) which is to get the value of the angle formed by the direction of the magnetic meridian (H) to the total intensity is by calculating the value of inclination, and the z-axis acts as the depth direction.

7 magnetic variables: (F) is the total intensity, (H) is Horizontal Intensity, (X) is North Components, (Y) is East Components, (Z) is the Vertical Component, (I) is The Geomagnetic Inclination, (D) is Geomagnetic declination (Reynolds, 1995).

BASELINE VALUES FOR THE YEAR OF 2020

2020 MAGNETIC STORM REPORT

A geomagnetic storm is a major disturbance of Earth's magnetosphere that occurs when there is a very efficient exchange of energy from the solar wind into the space environment surrounding Earth. These storms result from variations in the solar wind that produces major changes in the currents, plasmas, and fields in Earth's magnetosphere. Disturbances in the Earth's geomagnetic field can disrupt the operation of critical infrastructures relying on space-based assets but also can result in terrestrial effects, including disrupting electricity distribution networks.

There are several scales used to measure the severity of geomagnetic storms. The K and Ak indices are used to categorize the intensity of geomagnetic storms. The K values range from 0 to 9 and are based on the maximum magnetic field deviation during a 3-hour period. The Ak index values range from 0 to 400 for "a 24-hour index derived from eight daily 3-hour K indices" (Molinski et al., 2000). So-called "active" geomagnetic storms are classified with K values ranging from 0 to 4 and Ak values ranging from 0 to 20. A "minor" geomagnetic storm classification is based on a K value of 5 or Ak values ranging from 30-50. A "severe" geomagnetic storm is categorized using K values ranging from 7 to 9 and Ak values ranging from 100-400 (Molinski et al., 2000). Switching scales in 1999, the National Oceanic and Atmospheric Administration (NOAA) introduced the G scale, based on the planetary K index to measure the projected geomagnetic effects on physical infrastructure (Molinski et al., 2000). G is scaled from 1 to 5 (related to Kp=5 for G1, Kp=6 for G2, Kp=7 for G3, Kp=8 – 9– for G4 and Kp=9 for G5)

In 2020, Tangerang Geophysics Station didn't record any any indication of magnetic storm event.
